Digatron DT- 51K Instructions

Table of Contents

Welcome to Digatron

This manual covers the operation of your DT-51K instrument. Both racers and recreational riders can use this instrument. Racers may be interested in recording in time segments, either laps or sections of the strip or course. Recreational drivers will usually be interested in recording without laps.

This book provides the information you need to quickly set up and use your instrument. It is a great reference guide.

If you are interested in learning more about how your Digatron instrument can help you analyze your engine functions and driving techniques, please visit our website, www.digatronusa.com, or phone (509) 467-3128.

Note: These instructions cover current versions. If you have an older version, and find the instructions don't exactly match, please contact Digatron at support@digatronusa.com or toll free at 866.344.2876.

Instrument Functions

A. Power/Record

Start Vehicle. Instrument turns on and starts recording automatically when a tach signal is received. Records for 2 hours, then records over oldest data.
B. Overall Maximums

1. [ENGINE MAX] Press and hold.

2. [ENGINE MAX] Press and release to cycle through up to three sets of engine data.

3. Repeat steps 1 & 2 as desired.
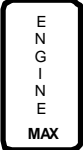

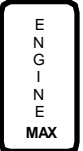

C. Lap Times (Time Segments) Optional

1. [PLAY PAUSE] Shows lap time for the last recorded lap. Laps are created with a beacon transmitter and receiver or manual store switch.

2. [LIGHT] OR [SET UP] Changes lap backward or forward one. Displays flash when your best lap is shown.

3. [EXIT POWER] Return to monitor / record mode.

D. Maximums by Lap

1. Select a lap. See C. Lap Times.

2. [ENGINE MAX] Displays engine data, showing maximum values for this lap.

2A. [TIME EVENT] Displays lap data. Press and hold to view Event number.

3. [LIGHT] OR [SET UP] Changes lap backward or forward . Displays flash when your best lap is shown.

4. [EXIT POWER] Return to monitor / record mode.

E. Playback

1. Select a lap. See <u>C. Lap Times</u>.

2. [ENGINE MAX] Press to view engine data.

3. [PLAY PAUSE] Begins playback of selected lap. Pause and resume playback with each press.

4. [↓ SET UP] If paused, steps through data in 0.1 second increments. If not paused, press and hold to fast forward.

5. [↑ LIGHT] If paused, reverse steps through data in 0.1 second increments. If not paused, press to reverse. Hold for fast reverse.

6. [ENGINE MAX] Press and release to cycle through up to three sets of engine data.

6A. [TIME EVENT] Press and release to cycle through Lap Numer, Lap Time, Event Number.

7. [EXIT POWER] Press once to return to <u>C. Lap Times</u>. Press again to return to monitor/ record mode.

F. Reset (clear memory)

1. [PLAY PAUSE] And [↓ SET UP] Press at same time.

2. [PLAY PAUSE] Press when display flashes. Aborted if not pressed within 10 seconds.

G. Power Off

1. [EXIT POWER] Turns instrument off if it is not recording or receiving a tach signal.

OR

The instrument will turn off automatically if it does not receive any button presses or a tach signal.

Battery Installation

Two AAA batteries power the DT-51K. These allow the instrument to run for 40 hours with the backlight on and 150 hours with the backlight off. The instrument will display ⌐o⌐, signaling that the batteries are low, several hours before the functions becomes inaccurate.

To replace the batteries, remove the screw from the battery door on the back of the instrument. Replace the two batteries, observing battery polarity.

If your instrument is stored for a long period of time, remove the batteries.

How Time is Displayed

Time is displayed as a 20 second timer. After 19.99 seconds the displayed time wraps back to zero. To see total time, up to 19:59 minutes, press and hold the Time button.
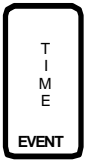

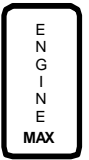

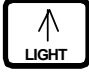

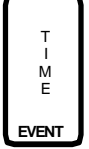

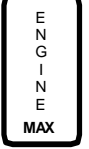

Setting Limits and Warning Lights

Limits and warning lights warn you of conditions that could be harmful to your vehicle's engine. They should be set at levels that allow you to react to the visual warnings before engine damage occurs.

There are two ways to set your limits and warning lights:

♦ **With Your Instrument** (see the next pages).

♦ **With Your PC**, download cable and configuration software (page 9).

<u>S</u>etting the <u>E</u>ngine <u>L</u>imits and Delay Time

1. [↓ SET UP] From monitor/record, instrument enters Set Up menu. SEL will flash on display.

2. [TIME EVENT] OR [ENGINE MAX] With SEL flashing, press either side button to enter Set Engine Limits.

3. [↑ LIGHT] OR [↓ SET UP] Press either button to change the number being displayed. Hold the button to change the number faster.

4. [TIME EVENT] OR [ENGINE MAX] Press either button to set next limit. Repeat steps 3 & 4 until all limits and calibration numbers are set.

5. [EXIT POWER] Press once to return to Set Up menu. Press again to return to monitor/ record mode.

Function limits are set in the following order: Temp (C1), Temp(C2), Tach (RPM1), Tach calibration number and Delay Time. If you are not using any functions on your instrument, set its limit to any number greater than 200.

About Delay Time (Optional, for Racing)
Some sanctioning bodies do not allow racers to use infrared beacon transmitters and receivers. If this is true for you, set your delay time to .1.

The delay time allows your instrument to ignore extra beacon signals at the track. Delay time is the time, in tenths of a second, that your instrument ignores beacon signals after receiving a signal. The delay time must be less than your best possible time between beacons (lap), or the instrument will miss your beacon signal. Delay time is set in ⌜SEL⌟ of Set Up mode.

For example, if it takes you approximately 16 seconds to complete a lap, set your delay number for 14 or 15 seconds. After your instrument receives its first beacon signal, it will ignore all signals for 14 or 15 seconds.

*Note: If you are not a racer, set your delay time to .1.

Tach Calibration Number
The Tach limit requires two separate parameters. The first is the maximum revolutions per minute (RPM) for safe engine operation. The second number, the Tach calibration, allows the instrument to display the correct RPM for your engine. The instrument divides the Tach input signal by the Tach calibration number. This number can be .5 to 31.
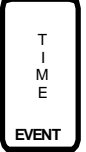

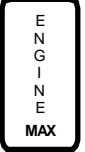

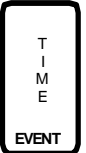

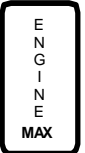

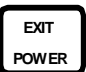

The most frequently used numbers are:

1 - for single cylinder 2 cycle and most 4 cycle motors

2 - for 2 cylinder 2 cycle and 4 cylinder 4 cycle motors

If you are unsure of the Tach calibration number for your engine, experiment. For example, if your calibration number is currently set at 2 and the RPM displayed is double what it should be, set the number to 4.

<u>S</u>etting the <u>LED</u> Warning <u>L</u>ights
Multiple warning lights can be set to the same function, but only one function can be set to a light.

1. **SET UP** ↓ From monitor/record, instrument enters Set Up menu. SEL will flash on the display.

2. **PLAY PAUSE** Press and SLL will flash on the display.

3. **TIME EVENT** OR **ENGINE MAX** With SLL flashing, press either button to enter Set LED Warning Lights.

4. **PLAY PAUSE** Press to change the function the light will correspond to.

5. **LIGHT** ↑ OR **SET UP** ↓ Press either button to change the number being displayed. Hold the button to change the number faster.

6. **TIME EVENT** OR **ENGINE MAX** Press either button to set next light. Repeat steps 4 - 6 until all lights are set.

7. **EXIT POWER** Press once to return to Set Up menu. Press again to return to monitor/ record mode.

PC Software: Set Up & Analysis
All limits and warning lights can be set on your PC with our configuration software. You can set different beacon signals as lap and splits. Recorded information can be downloaded to a PC. The instrument must be in Monitor/Record mode, with no Tach signal when hooked up to a computer. **The instrument does NOT need sensors hooked up.** Download the software from www.digatronusa.com. Attach the download cable to the white connector on your instrument. Attach the other end to any USB or serial port on your PC. Then follow the computer's instructions.

Recording
The instrument records in sessions called Events (shown by an **E**), which start each time the instrument begins recording. Within Events, time segments (Laps, **L** on the display) are created with infrared beacon receivers and transmitters or with a store switch. To end an Event your engine must be turned off, the ***Exit*** button must be pressed, or the Tach must go below 200 RPM (this value can be changed on your PC).

Moisture

Your instrument is designed to be water resistant. We recommend keeping it as dry as possible. Please cover or remove your instrument before washing your vehicle. Digatron offers tach bags to help keep the instrument dry. If moisture does get inside the instrument, remove the endcap without switches and let the instrument air out in a dry environment. A hairdryer, on low power, can accelerate drying.

Erratic Readings

If the instrument encounters excessive electrical interference it will display ERR on the left side of the top display. The stored data might be invalid, and may need to be erased.

To erase your stored data, see Reset on page 4.

The ERR enunciator can also indicate an incorrect instrument or sensor installation. If your instrument is doing strange things, put it in Set Limits and check to see that the limits and calibration number(s) are still where you set them (see page 5).

Installing a resistance plug boot can normally solve electrical interference problems. We recommend using an NGK boot, # LB05EMH.

To avoid erratic readings:
♦ Keep your temperature and Tach leads separated by at least 3".
♦ Route the leads as far away from the coil as possible.
♦ Install the Tach lead on the plug wire at least 2" back from the plug boot. If you still have a problem, try a different location on the plug wire.
♦ Replacing one or all of your sensors often solves this problem.

Please contact Digatron if your problem continues.

Button Functions

<u>**Lap**</u> (top, side button): (2) functions
>   A.   Displays lap time and number.
>
>   B.   Press and hold to show best lap time.

<u>**Engine**</u> (bottom, side button) (2) functions
>   A.   Cycles between up to three sets of data.
>
>   B.   Press and hold to show maximums and designators.

<u>**Power / Exit**</u> (2) functions
>   A.   Turns the instrument on and off.
>
>   B.   Exits Set Up and Playback modes.

<u>**← / Light**</u> (2) functions
>   A.   Press and hold to dim warning lights, and turn backlight on and off.
>
>   B.   Decreases values in Set Up and Playback.

<u>**→ / Set Up**</u> (2) functions
>   A.   Enter Set Up.
>
>   B.   Increases values in Set Up and Playback.

Play / Pause (2) functions
>   A.   Press for lap times, lap maximums and playback.
>
>   B.   Pauses and resumes playback.

Reset Instrument Erases recorded data and for troubleshooting.
>   A.   Press **Play / Pause** and → at the same time.
>
>   B.   Then press **Play / Pause** within 10 seconds.

Designator Definitions
The following is a list of designators that can appear in the main part of your display:
>   5EL   select this to set your engine limits
>   5LL   select this to set your warning lights
>   none   displayed if the *Play* button is pressed and there is no recorded data
>   oFF   displayed if a warning light is set to not come on
>   EAL   displayed when setting the Tach or MPH calibration number
>   lob   displayed if your batteries are low
> PrE5 PLAY during a reset of memory, press the *Play* button to proceed with reset
>   ELr   displayed if a reset of memory was successful
>   no ELr displayed if a reset of memory is not successful
>   LLP   last lap time
>   ELP   current lap time
>   bLP   best lap time
>   di5   lap distance
>   HrS   total hours
>   odo   odometer
>   rEC   displayed when recording and the *Play* button is held
>   Erun   displayed if the engine is on when trying to enter Playback
>   P E   displayed when the instrument is communicating with your PC
>   E1 E2 Channel 1, Channel 2, which are temp1 and temp2 respectively
>   ---   when shown on the top of a display, the function is over ranging. when shown on the bottom of a display, the function is under ranging

The following is a list of enunciators that can appear on the side of your displays. These show what function is in the display:

RPM1	tach	RPM2	jackshaft RPM
CHT	cylinder head temperature	EGT	exhaust gas temp.
MEM	memory		

Repairs and Warranty Information

If you have any questions about the operation of your instrument, please call. One of our technicians will be happy to help you. Please have your instrument nearby to help while troubleshooting with the technician.

Your instrument is warranted to be free from factory defects and electronic failure for two years from the date of purchase. Physical damage during normal usage is not covered under the warranty. Be sure to fill out and return your warranty card for our records. If we do not have a card on file for your instrument, you will be charged for repairs unless you can provide us with proof of purchase date.

When returning an instrument for repair, please use the repair form found on our website or enclose a note indicating your return address, phone number and a detailed description of the problem. Send your instrument and sensors so that we can check the complete system.

Send repairs to:

Digatron LLC
